Portfolio / Migrate from Terraform to Crossplane

I wrote a blog post for Upbound explaining why teams should consider migrating from Terraform to Crossplane and had fun telling the story through a fictional startup.

The post walks through why Crossplane solves these issues: GitOps workflow, no state files, continuous reconciliation to prevent drift, and native Kubernetes integration. I showed how provider-terraform makes the transition easy and gradual.

By grounding it in a relatable scaling story with real pain points, developers could see themselves in this situation and understand the actual problems Crossplane solves.
